

## The Use of Frequency Inverters with BITZER Screw Compressors

### Why Frequency Inverter?

- Possibility for infinite speed modulation with 3-phase asynchronous motors
  - stepless capacity regulation
  - Capacity increase by operation higher than synchronous speed (trans-synchronous speed)
- Soft Start
  - significant reduction of starting current with full motor torque
    - starting current 100 to 160 % of RLA
    - no start unloader required
  - reduced mechanical loading on compressor
  - minimized danger of oil and liquid slugs during start-up

## The Use of Frequency Inverters with BITZER Screw Compressors

### Function of Frequency Inverter

- Frequency Modulation

$$n_{\text{Motor}} = \frac{f \times 60}{\text{No. of Pole Pairs}} - n_{\text{Schlupf}}$$

- Ratio Voltage / Frequency  $U / f \Rightarrow$  constant

- reduction of frequency leads to
  - ⇒ lower winding resistance
  - Consequences if no voltage adaption
  - ⇒ increasing motor current
  - ⇒ magnetic saturation of motor iron
  - ⇒ resulting in overheating

3.01 FQINV\_SV\_E-2

## The Use of Frequency Inverters with BITZER Screw Compressors

### Requirements on Motor Characteristics and Layout of Frequency Inverter

- Positive Displacement Compressors ⇨ Torque\* Remains "Constant" with Speed Change

- Power absorbed changes approx. proportionally in relation to the speed

$$M = \frac{P \times 9,55}{n \text{ (1/min)}} \text{ [Nm]}$$

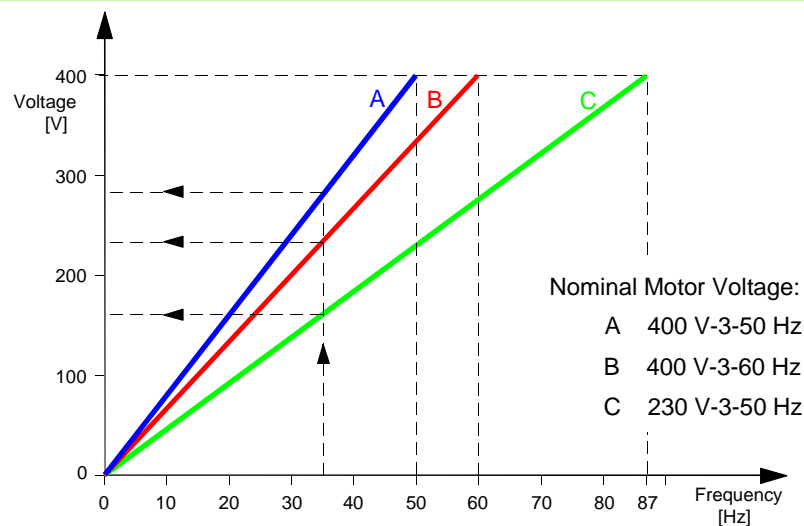

$$P = U \times I \times \sqrt{3} \times \cos\phi \text{ [W]}$$

\* with fans and pumps **M** changes in square to **n**

## The Use of Frequency Inverters with BITZER Screw Compressors

### Semi-Hermetics + Hermetics - General Selection Criteria (1)

#### □ Frequency and Speed Ranges

- Standard range 25 to 60 Hz / 1450 to 3500 RPM
- Extended range (individual investigation required!!)
  - ➔ HS.53 & HS.64 20 to 75 Hz / 1200 to 4500 RPM  
HSKC 64
  - ➔ HS.74 20 to 67 Hz / 1200 to 4000 RPM  
HSKC74 & CS75
  - ➔ VSK 31 20 to 87 Hz / 1200 to 5200 RPM
  - ➔ VSK 41 20 to 70 Hz / 1200 to 4200 RPM

3.01 FQINV\_SV\_E-8

## The Use of Frequency Inverters with BITZER Screw Compressors

### Semi-Hermetics + Hermetics – General Selection Criteria (2)

- ❑ Critical Frequency and Speed Ranges
  - dependent on operating conditions resonances may occur in certain frequency (speed) ranges
    - ➔ Compressor & Pipe lines
  - Examination by tests under real conditions
    - ➔ critical frequency ranges must be "jumped" by adequate programming of the inverter

3.01 FQINV\_SV\_E - 9

## The Use of Frequency Inverters with BITZER Screw Compressors

### Semi-Hermetics + Hermetics – General Selection Criteria (3)

- ❑ Motor Selection / Voltage & Frequency for 50 Hz power supply
  - Standard Motors (400V-3-50Hz) --  
Suitable up to **60 Hz** (400V) if 25 % spare capacity at 50 Hz
  - Special Motors (400V-3-60 Hz or 230V-3-50 Hz)  
for trans-synchronous operation with full motor load

Consequence:      Operation not possible with direct supply  
(400V / 50Hz) –larger inverter required

Note!                Dependant on inverter design and quality of sine wave,  
additional spare capacity for the motor may be needed

3.01 FQINV\_SV\_E - 10

## The Use of Frequency Inverters with BITZER Screw Compressors

### Semi-Hermetics + Hermetics – General Selection Criteria (4)

#### ❑ Motor protection

Due to the harmonics created by the inverter the protection unit INT 389R is limited in its operating range (will trip with low frequency).

Alternative system:

- INT 69VSY-II combined with additional anti short cycling timer
- possibly additional external overloads (dependent on inverter overload protection system)

#### ❑ Control of oil injection solenoid valve

- ensure energizing of the solenoid two seconds after start
  - ➔ too early oil supply leads to blocking of the compressor
  - ➔ too long delay provokes mechanical damage & shaft seal leakage

## BITZER Screw Compressors Start Procedure with Frequency Inverter

3.01 FQINV\_SV\_E - 12

## The Use of Frequency Inverters with BITZER Screw Compressors

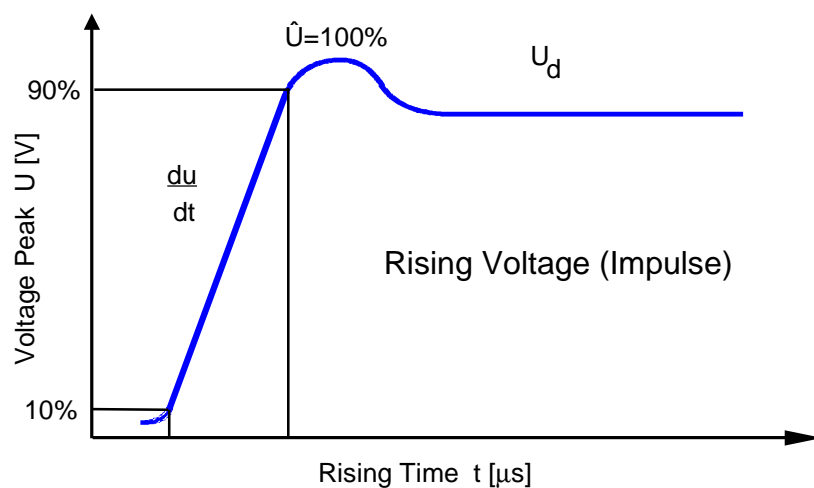

### Special Requirements on Frequency Inverter and Connection Wires

- Voltage magnitude due to diagram
  - Consider length of wire in manufacturer's documentation!!
  - Possible problems: Motor noise / Insulation failures
- Exceeded voltage magnitude: Use of sine wave throttles
- Inverter selection for "1.6 times max. torque" (one minute)
- In case the inverter can be programmed for "Optimized Energy Consumption" an adaption to the real motor efficiency is needed
- Screened wires (incl. grounding) from inverter to motor

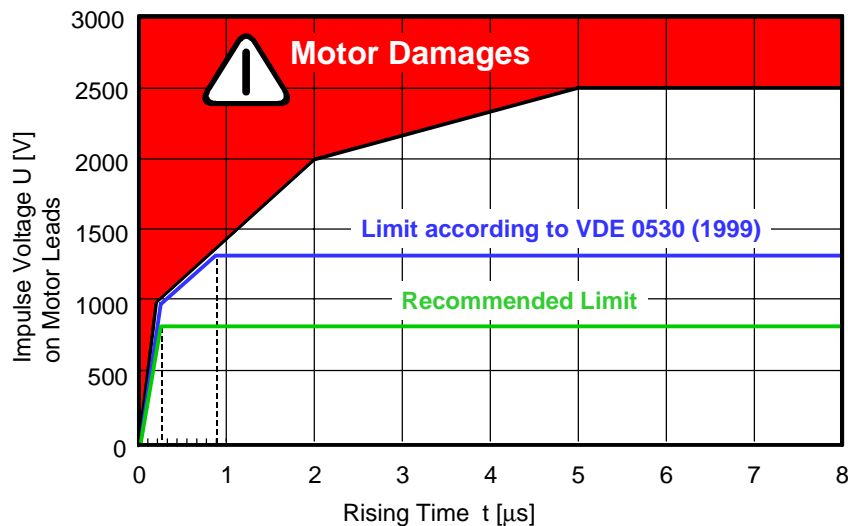

3.01 FQINV\_SV\_E - 13

3.01 FQINV\_SV\_E - 15

## The Use of Frequency Inverters with BITZER Screw Compressors

### Open Type Compressors – General Design Criteria (1)

- Speed ranges OS.53
  - Standard range 1450 to 4500 RPM
  - Extended range 1200 to 4500 RPM
    - individual investigation required !!!
- Speed ranges OS.74
  - Standard range 1450 to 4000 RPM
  - Extended range 1200 to 4000 RPM
    - individual investigation required !!!

3.01 FQINV\_SV\_E - 16

## The Use of Frequency Inverters with BITZER Screw Compressors

### Open Type Compressors – General Design Criteria (2)

- ❑ Critical Frequency and Speed Ranges
  - dependent on operating conditions resonances may occur in certain frequency (speed) ranges
    - Compressor & Pipe lines
    - Coupling (observe moment of inertia & natural frequency)
    - Belt drive (possibly idle pulley required)
  - Examination by tests under real conditions
    - critical frequency ranges must be "jumped" by adequate programming of the inverter
- ❑ Control of oil injection solenoid valve
  - ensure energizing of the solenoid two seconds after start (see further information on slide No. 8)

3.01 FQINV\_SV\_E - 17

## The Use of Frequency Inverters with BITZER Screw Compressors

### Open Type Compressors – Selection Criteria for Motor and Inverter

- ❑ Motor selection according to manufacturer's requirements  
Special Criteria:
  - Air flow is not in proportion to the motor speed
    - increased power with trans-synchronous operation
    - possibly insufficient cooling with sub-synchronous operation
- ❑ Motor Selection / Application Range
  - dependent on inverter design and quality of sine wave additional spare capacity for the motor may be required
- ❑ Inverter selection according to specification of motor and inverter manufacturers
